			ART UNIT 2162	PAPER NUMBER
			MAIL DATE 12/27/2007	DELIVERY MODE PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	<b>Application No.</b> 09/925,397	<b>Applicant(s)</b> CHANG ET AL.	
	<b>Examiner</b> Fred I. Ehichioya	<b>Art Unit</b> 2162	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 04 October 2007.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 20 - 39 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 20 - 39 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on October 4, 2007 has been entered.
2. claims 20 – 39 are pending in this Office Action

### ***Response to Arguments***

3. Applicant's arguments with respect to claims 20, 27 and 34 have been considered but are moot in view of the new ground(s) of rejection.

### ***Claim Rejections - 35 USC § 103***

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein

Art Unit: 2162

were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

5. Claims 20, 27 and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Non-Patent Document: "Relevance Feedback: A Power Tool for Interactive Content-Based Image Retrieval" by Rui et al (hereinafter "Rui") in view of Non-Patent Document: "A Fuzzy Object Query Language (FOQL) for Image databases" by Nepal et al (hereinafter "Nepal").

Regarding claims 20 and 27, Rui teaches a method for processing multimedia data in a computer system, comprising:

receiving as input a high-level concept describing data to be accessed (page 644, Abstract: "During the retrieval process, the user's high-level query and perception subjectivity are captured");

translating the high-level concept into a low-level query by using stored concept constructs which are defined using features derived from a plurality of application domains (page 645, column 1, paragraph 1: "mapping a high-level concept (fresh apple) to low-level features (color or shape)" – the domains are fruit, color and shape and also page 645, column 2, paragraph 1: "high-level concepts can be captured by low-level features").

Rui does not explicitly teach transferring the low-level query to one or more search engines as claimed.

Nepal teaches transferring the low-level query to one or more search engines to access information using the low-level query (page 123, column 2, paragraph 1: "the image retrieval is accomplished based on low level features such as color and texture").

It would have been obvious to one of ordinary skill in the data processing art at the time of the present invention to combine teaching of the cited references because Nepal's teaching of "transferring the low-level query to one or more search engines to access information using the low-level query" would have allowed Rui's system to formulate queries and handle problems such as mapping low level features to high level concepts. The motivation is that these queries and data in image databases are inherent in nature.

Regarding claim 34, Rui discloses a system for processing multimedia data in a computer system, comprises:

a concept translation engine that receives a high-level concept describing data to be accessed page 644, Abstract: "During the retrieval process, the user's high-level query and perception subjectivity are captured"), translates the high-level concept into a low-level query using a hierarchy of stored concept constructs which are defined by features derived from a plurality of application domains (page 645, column 1, paragraph 1: "mapping a high-level concept (fresh apple) to low-level features (color or shape)" – the domains are fruit, color and shape and also page 645, column 2, paragraph 1: "high-

Art Unit: 2162

level concepts can be captured by low-level features”; It is implicit and inherent in this situation that there is a type of code, algorithm or engine that maps/translated high-level concept to low-level concept).

Rui does not explicitly teach constraint or transferring the low-level query to one or more search engines as claimed.

Nepal discloses constraints (page 121, column 2: “constraint specified”) among sibling elements in the hierarchy (page 120, column 1: “a collection of images can be classified into various groups . . . the inverse relationship of the images with their respective collection”).

and transfers the low-level query to one or more search engines to access information using the low-level query (page 123, column 2, paragraph 1: “the image retrieval is accomplished based on low level features such as color and texture”); and

a concept repository for storing and accessing the concept constructs (page 123, column 2, paragraph 2: “concept definitions are stored in the database”).

It would have been obvious to one of ordinary skill in the data processing art at the time of the present invention to combine teaching of the cited references because Nepal’s teaching of “transferring the low-level query to one or more search engines” would have allowed Rui’s system to formulate queries and handle problems such as mapping low level features to high level concepts. The motivation is that these queries and data in image databases are inherent in nature.

Art Unit: 2162

6. Claims 21 – 26, 28 – 33, and 35 - 39 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rui in view of Nepal and further in view of Non-Patent Document: "CAMEL: Concept Annotated iMagE Libraries", In Storage and Retrieval for Image and Video Database, San Jose, CA, Jan. 2001. SPIE (numbered pages 1 – 12), Author: Natsev et al (hereinafter "Natsev").

Regarding claims 21, 28 and 35, Rui and Nepal disclose the claimed subject matter as discussed in claims 20, 27 and 34 respectively.

Rui or Nepal does not disclose concept library as claimed.

Natsev discloses storing the concept constructs in a concept library module (see Fig. 1 "concept library" and Section 1.2 "The concept library is module for a persistent storage of concepts");

storing the features in a feature library module (see Fig.3 "Feature index");

storing constraints in a constraint library module (see section 6, "Another improvement that we are considering is the introduction of spatial constraints in the query engine. For example . . . the corresponding document is ranked higher"); and

storing matching algorithms in a matching algorithm library module (see section 3: "Since the feature. . . , the region matching definition still applies" – "matching definition" is "matching algorithm").

It would have been obvious to one of ordinary skill in the data processing art at the time of the present invention to combine teaching of the cited references because Natsev's teaching of storing the concept constructs in a concept library module, storing

Art Unit: 2162

the features in a feature library module and storing constraints in a constraint library module would have presented a new direction for improving current image query system, namely focusing the query specification part as gateway to better performance and usability (see Natsev section 6) for the combination Rui and Nepal's system.

Regarding claims 22, 29 and 36; Natsev teaches interfacing the library modules to the application domains (see fig.3 and section 4, "Fig.3 illustrates the architecture of the ..., as well as the Concept Library module").

Regarding claims 23, 30 and 37, Natsev teaches building a concept construct (see fig.1 and section 1.2, The concept cataloguing, or learning, phase is used to define visual concepts and build concept library. Concepts are defined . . . and to associate it with the given concept").

Regarding claims 24 and 31, Natsev teaches a method as defined in Claim 23, wherein the step of building a concept construct comprise combining one or more of the features with see section 1.2, The concept cataloguing, or learning, phase is used to define visual concepts and build concept library)

zero or more of the stored concept (see Fig.1 and section 1.2, "The concept library is a module for persistent storage of concept"), and

zero or more of the constraints (see section 6, "Another improvement that we are considering is the introduction of spatial constraint in query engine").

Regarding claims 25 and 32, Nepal teaches a concept construct is represented using a hierarchical fuzzy graph data tree-structure comprising:

nodes that correspond to child-concepts and a subset of the features (page 120, column 1: "a collection of images can be classified into various groups . . . the inverse relationship of the images with their respective collection");

aggregation edges that correspond to parent-child relationships (page 119, section 3: "The Img-comp type is defined for image component objects, the Image type for image objects and Img-col type for collection of images. In the figure, the relationship types are shown by lines"); and

association edges that correspond to inter-sibling constraints (see page 119, column 1: A fuzzy set of object is a (usual) set of objects, with each object having associated membership value").

Regarding claims 26 and 33, Natsev teaches a method as defined in Claim 20, wherein the features are user defined (see section 2, "One of the most commonly used image features is color histogram, . . . places the burden on the user to specify weights for the different features").

Regarding claim 38, Natsev teaches a system as defined in Claim 34, wherein the translation engine further comprises an interpreter that translates the high level concept (see fig.1).

Regarding claim 39, Natsev teaches a system as defined in Claim 34, further comprises a search engine (see section 2, "the high-level approach that . . . , there are some considerations that make certain query engines more suitable than others".

### **Conclusion**

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Fred I. Ehichioya whose telephone number is 571-272-4034. The examiner can normally be reached on M - F 8:00 AM to 4:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, John E. Breene can be reached on 571-272-4107. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
